PROFESSIONAL SUMMARY

Results-driven recent Computer Science graduate actively seeking a fresher Data Analyst role. Proficient in SQL, Python, Excel and Power BI with proven experience in data cleaning, exploratory data analysis (EDA), data visualization and interactive dashboard development. Skilled at converting large, complex datasets into clear business insights that enable confident, data-driven decision-making.

SKILLS

Technical Skills: Python (Pandas, NumPy, Matplotlib, Seaborn), SQL (MySQL), Microsoft Excel (Pivot Tables, VLOOKUP)

BI & Visualization Tools: Power BI, Dashboard Creation, Data Modeling, Data Reporting, Jupyter Notebook, Git, GitHub

Analytics Concepts: Exploratory Data Analysis (EDA), Data Cleaning, Data Transformation, Statistical Analysis, KPI Reporting, Customer Segmentation, RFM Analysis

Database Management: MySQL, Query Optimization, Joins, Aggregations, CTEs, Window Functions, Subqueries

Other: Salesforce CRM, Agentforce, Workflow Automation, VS Code, Microsoft 365

PROJECTS

Retail Sales Performance Analysis | *Python · SQL · Power BI · Pandas · Matplotlib · Seaborn · Excel*

- Analyzed 541,909 retail transactions using Python (Pandas) and SQL; executed end-to-end data cleaning — removing nulls, duplicates and cancelled orders — improving dataset accuracy by 30%.
- Conducted EDA and engineered 6 time-based features (month, day, hour); identified a 40% revenue spike in November, informing inventory pre-loading and seasonal promotion strategies.
- Authored 9 advanced SQL queries using CTEs, window functions and aggregations to surface month-over-month growth trends, top-10 revenue products and country-level sales distribution.
- Developed 5 business visualizations and a Power BI KPI dashboard revealing UK drives 84% of revenue and a 16% order cancellation rate — delivering 4 actionable business recommendations.

Customer Segmentation using RFM Analysis | *Python · SQL · Scikit-learn · Power BI · Pandas · Seaborn*

- Built an RFM (Recency, Frequency, Monetary) scoring engine for 4,300+ customers using Python and SQL; assigned quintile-based scores to systematically rank purchasing behaviour.
- Segmented customers into 5 actionable groups (Champions, Loyal, Potential Loyalists, At-Risk, Lost); identified top 18% of customers contributing 55% of total revenue.
- Applied K-Means Clustering (K=4, Silhouette Score: 0.62) with StandardScaler and log normalization using Scikit-learn; validated optimal K via Elbow Method and Silhouette analysis.
- Delivered segment-level marketing strategies projecting £80K+ revenue recovery from At-Risk customers; visualized customer profiles through an interactive Power BI dashboard.
